The transplant center at the University of California, Davis, is the largest deceased-donor kidney transplant center in the United States by volume for each of the last three years. The program has more than tripled in size over the last decade, over which time the national trend in kidney transplantation has been flat. Our multi-disciplinary specialists collaborate to offer our patients waiting times shorter than any other California center and less than half the national average. Following transplant, our patients experience excellent outcomes, as measured by the risk-adjusted outcomes published by the Scientific Registry of Transplant Recipients (SRTR). In the most recent report, published in June of 2015, UC Davis was one of only four centers in the US to offer statistically significantly better than expected one-year patient survival for recipients of deceased-donor kidneys.

The following data, sourced from the Organ Procurement and Transplantation Network (OPTN) and SRTR illustrate this success.
