You wouldn’t know it to see him today, but Teddy Reynolds was born blind – his lenses covered by hereditary cataracts. If not corrected early, Teddy’s brain would never “learn” to see. But within his first two months of life, pediatric ophthalmologists at UC Davis surgically removed both cataracts and equipped him with special high-powered lenses – which get swapped out regularly as he grows and his vision changes. Today, Teddy studies Taekwondo, plays soccer and is learning to surf. This is one little boy with a bright future.
